

Transformation Notes--Absolute Value

1. If absolute value brackets are around the entire function $f(x)$, all negative y -values become positive y -values.

Example: $y = | f(x) |$

Quadrants 3 and 4 will move onto Quadrants 1 and 2.
All x -axis points will stay where they are

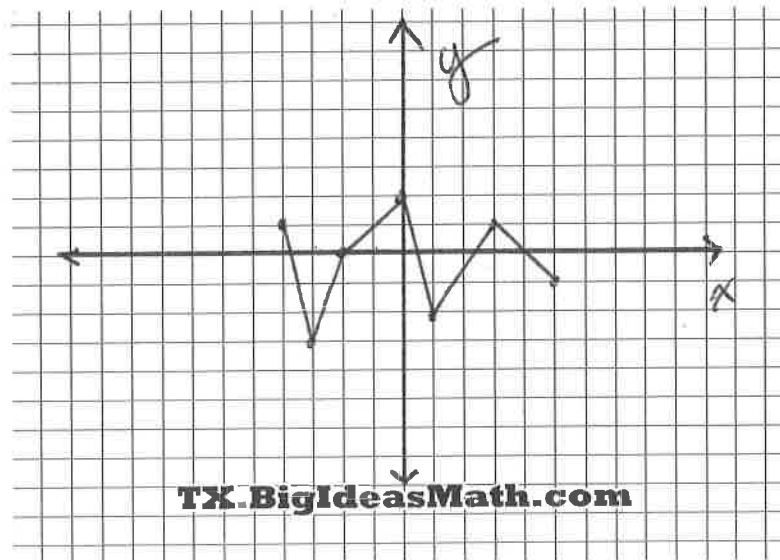

2. If absolute value brackets are around the x in the function $f(x)$, the y -values on the right of the y -axis will repeat on the left side of the y -axis, and the old Quadrant 3 and 4 points will go away.

Example: $y = f(| x |)$

Quadrants 1 and 4 will repeat over the y -axis in Quadrants 2 and 3, causing old points from Quadrants 2 and 3 to disappear.

Absolute Value:

Given $f(x)$

1. graph $y = | f(x) |$

2. graph $y = f(| x |)$

TX.BigIdeasMath.com

Activity: Move the Monster

Given : $h(x)$

Sketch the graph of:

1. $-h(x)$

2. $h(-x)$

3. $h(x)+2$

$(x)h \frac{1}{5}$

4. $h(x)-2$

5. $h(x+2)$

6. $h(x-2)$

7. $2h(x)$

8. $\frac{1}{2}h(x)$

9. $h(2x)$

10. $h\left(\frac{1}{2}x\right)$

11. $|h(x)|$

12. $h(|x|)$

Transformation	What It Does	Example	Graph

Original Function	Transformation	Explanation
		Flip the function around the x axis, and then around the y axis. It actually doesn't matter which flip you perform first.
		Flip the function around the x axis, and then reflect everything below the x axis to make it above the x axis; this takes the absolute value. We actually could have done this in the other order, and it would have worked!
		For the absolute value on the inside, throw away the negative x values, and replace them with the y values for the absolute value of the x . Then reflect everything below the x axis to make it above the x axis; this takes the absolute value. We could have done this in any order.
		Do everything we did in the transformation above, and then flip the function around the x axis, because of the negative sign. For this one, I noticed that we needed to do the flip around the x axis last (we need to work "inside out").

Transformation	T-chart	Graph																
Original Function (Points)	<table border="1"> <thead> <tr> <th>x</th> <th>y</th> </tr> </thead> <tbody> <tr><td>-9</td><td>2</td></tr> <tr><td>-6</td><td>-4</td></tr> <tr><td>-2</td><td>2</td></tr> <tr><td>0</td><td>0</td></tr> <tr><td>2</td><td>-2</td></tr> <tr><td>6</td><td>0</td></tr> <tr><td>9</td><td>6</td></tr> </tbody> </table>	x	y	-9	2	-6	-4	-2	2	0	0	2	-2	6	0	9	6

<p>Make a symmetrical graph from the positive x's across the y axis. "Throw away" the left hand side of the graph (negative x's), and replace the left side of the graph with the reflection of the right hand side.</p> <p>OR</p> <p>For any negative x's, replace the y value with the y value corresponding to the positive value (absolute value) of the negative x's. For example, when x is -9, replace the y with a 6, since the y value for positive 9 is 6.</p> <p>Example Function: $y = x - 4 ^3$</p>	<table border="1"> <thead> <tr> <th>x</th> <th>y</th> </tr> </thead> <tbody> <tr><td>-9</td><td>2</td></tr> <tr><td>-6</td><td>-4</td></tr> <tr><td>-2</td><td>2</td></tr> <tr><td>0</td><td>0</td></tr> <tr><td>2</td><td>-2</td></tr> <tr><td>6</td><td>0</td></tr> <tr><td>9</td><td>6</td></tr> </tbody> </table>	x	y	-9	2	-6	-4	-2	2	0	0	2	-2	6	0	9	6
